Education

University of Helsinki – Master of Science in Computer Science Expected May 2027

University of Helsinki – Bachelor of Science in Computer Science May 2025

- GPA 5/5
- Completed my thesis on AI-powered Kubernetes autoscaling

Experience

Software Engineer Intern, Palantir – London, UK May 2026 – Present

- Infrastructure

Software Engineer Trainee, Ericsson – Kirkkonummi, FI March 2024 – May 2026

- Migrated 5 enterprise databases (15TB+) from InfluxDB to TimescaleDB with zero downtime by building custom Go migration jobs for distributed Kubernetes clusters
- Designed fault-tolerant, highly available database instances with custom Kubernetes operators and automated failover, reducing backup times by 90% and storage footprint by 95%
- Developed Go microservices for RF data collection from thousands of network elements to our database
- Worked on various Python ML services that predict network state using trained inference models
- Improved CI pipelines for 200+ developers by introducing caching, optimized test execution, and upgrade-in-place deployments, significantly reducing build times

Founder, Vebbi – Helsinki, FI June 2023 – March 2024

- Built and deployed Next.js websites achieving 100% PageSpeed scores, ensuring scalability and performance
- Integrated Hygraph CMS with GraphQL APIs, streamlining content management for non-technical users
- Managed end-to-end client delivery from design to deployment

Skills

Languages: Go, Python, Java, JavaScript

Frameworks & Tools: React, Next.js, Terraform, Ansible, Ent, React

Cloud & Distributed Systems: Kubernetes, Docker, Helm, AWS

Projects

Datakolo github.com/3nd3r1/datakolo

- Built a Deno + MongoDB + Next.js CMS with schema flexibility and real-time content APIs supporting 1000+ concurrent requests
- Designed intuitive UI enabling content publishing without technical knowledge
- Developed CI/CD pipeline with automated testing and deployment

Commute.ai github.com/Commute-ai

- Built an AI-powered public transport routing app using React Native, Python FastAPI, and PostgreSQL with microservices architecture integrating HSL transit APIs
- Designed AI agent system that personalizes route recommendations based on user preferences (scenic vs. fast, comfort vs. efficiency) and real-time commuter insights
- Collaborated in agile team of 4 engineers using multi-repo workflow with automated deployments, achieving weekly feature releases from planning to production
